

# Protect your organisation with better password management

Password security is an area that organisations and individuals all struggle with; it is one of the largest security threats to an organisation. Organisations often think of password management as being just about user login passwords, but with the plethora of cloud services in use, your team need help in ensuring that all of the passwords they use at work, are strong and secured.

**Weak and stolen passwords account for 81% of security breaches.** Helping your team to use strong passwords, that they don't need to write down in order to remember, and to share passwords for multiuser services, such as vendor website logins, is a very real challenge.

## No more passwords on post-it notes

Long gone are the days that you would note down your password on a piece of paper or a post-it note, and use it across multiple systems. However, having unique passwords across multiple platforms, of sufficient complexity to be secure, has given users the headache of how to remember what password unlocks which site. Then you have the added issue of passwords that need to be shared, for example, access to a supplier website where multiple colleagues need to know the company login. The answer lies in the use of a secure password management tool.

## What is Password Boss?

Password Boss allows you to save all your passwords for any websites, or apps you use and access them from any device using a single 'master password'. The Master Password is not stored or transmitted anywhere, even Password Boss does not have a copy. If you regularly visit a website, Password Boss will automatically enter your username and password for you to simplify logging in. It will also help you to create unique and strong passwords for every different site you visit and advises you on any weak or repeated passwords in use. Password Boss performs 'dark scans', by scanning all of your passwords and accounts to find out which have been stolen in security breaches. Password Boss enables users to:

- **Use unique, complex passwords on multiple websites, whilst only having to remember one master password.**
- **Auto complete web forms with pre stored payment card records, addresses and personal details.**
- **Securely share access information to websites with colleagues, without having to reveal the actual password details. Great for accessing things like corporate Amazon accounts or vendor purchasing sites for example.**

# Why choose Password Boss?

Without a password manager, each user in your business is put in the role of implementing security for your business. Nowhere else in your business do users have this level of responsibility. Password Boss is effective for the following reasons;

## Complete password security

Password Boss uses world class security to protect your information from hackers and cyber criminals.

## Easy password sharing

Your team can securely share passwords with others and revoke access when needed.

## Visibility so you can act

Password Boss shows you where your security risks are so you can take action.

## Fast user adoption

Intuitive design, strong password generator and website autofill keep your users happy.

## Rapid deployment

Onboard users quickly from the management portal. Simple AD integration.

## Dark Web Scanning

Hacked passwords put your business at risk. Our Dark Web scans show you where those risks are.
