Navigating your Copilot for Microsoft 365 journey: Copilot Readiness and implementation

What is AI and Copilot for Microsoft 365

Al, or Artificial Intelligence, is the field of computer science that aims to create machines and systems that can perform tasks that normally require human intelligence. Al technologies, such as machine learning, natural language processing, and robotics, can help us solve complex problems, automate processes, and generate new insights from data. Copilot for Microsoft 365 is an example of how Al can be integrated into our everyday work tasks, such as creating documents, presentations, and spreadsheets. Copilot is not a substitute for human workers, but a helper that can improve our productivity and efficiency. However, Copilot also comes with challenges, such as ensuring its adoption, security, and compliance within our environments. Therefore, we need to plan and strategise how to best use Copilot and its Al capabilities.

What the business challenges are of using AI and Copilot for Microsoft 365?

Al and Copilot for Microsoft 365 offer tremendous opportunities for organisations to redefine work and inspire innovation. However, they also pose significant challenges in terms of data, security, and privacy. Organisations need to understand their personas and workloads, and set clear and consistent policies for using Copilot for Microsoft 365 and its Al capabilities. Some of the key challenges they need to overcome are:

- Ensuring data compliance and security, and preventing data breaches or misuse
- Setting boundaries and policies for usage, and avoiding overreliance or abuse of the technology
- Steering innovation responsibly, and aligning Copilot for Microsoft 365 with their organisational goals and values

By being prepared and proactive, organisations can overcome the hurdles and unlock the full potential of AI and Copilot for Microsoft 365.

What's in a name? Introducing the different types of Copilots

Microsoft has made a multibillion-dollar investment in OpenAI, the company that created ChatGPT and other AI breakthroughs. Microsoft is incorporating OpenAI's technology into its cloud services under the Copilot brand. Copilot will offer various AI products and features for different applications and industries.

The key copilots that organisations are most likely to use are Copilot for Web, Copilot for Windows and Copilot for Microsoft 365. Here are the main differences:

Copilot for Web

Copilot for web is a free version of Copilot that allows you to chat with an Al assistant in your web browser. You can access it at copilot.microsoft.com or in the Microsoft 365 app. Copilot for web uses commercial data protection and does not retain your prompts or responses.

Copilot for Windows

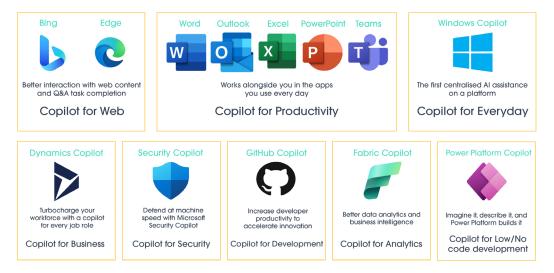

Copilot for windows is a feature that enables you to chat with Copilot in the Windows sidebar. You can toggle between Copilot for web and Copilot for Microsoft 365, depending on your licence and preference. Copilot for windows requires you to enable it in your settings.

Copilot for Microsoft 365

Copilot for Microsoft 365 is a premium licence that gives you access to Copilot features in Microsoft 365 apps, such as Teams, Loop, Word, Excel, PowerPoint, and Outlook. Copilot for Microsoft 365 uses Graph-grounded chat, which means it can leverage your organisational data and context to provide more relevant and personalised responses. This is a business or enterprise licence that requires a subscription to Microsoft 365 Business Standard or Premium, Microsoft 365 E3 or E5, or Office 365 E3 or E5.

Microsoft Cloud products will fall under the name of Copilot. There will be many Copilots and some additional examples are below:

How ramsac can help prepare you for your Copilot journey

Identify opportunities and uses for Copilot

We start with a readiness assessment, which defines the organisations vision and goals for using Copilot. This will identify the personas and potential scenarios that could benefit from its use, as well as licensing and technical configuration requirements.

Ensure data readiness and security

A key component before introducing Copilot into your organisation is to ensure that your sensitive data is protected. Off the back of the readiness assessment, we will advise on any remedial actions relating to this step before we move to the implementation phase.

Introduce it to your organisation

A pilot group of users should be chosen with a defined remit of how they should be testing Copilot to begin a phased rollout. ramsac will then work with you to ensure this is rolled out in a controlled and consistent manner.

Define your strategy

A documented strategy for introducing and maintaining Copilot within your organisation is a vital step. In this stage we ensure Copilot is aligned with the organisations business objectives and values, and that Copilot usage is compliant with internal policies and regulations

Train your staff

Before rolling out Copilot to the entire organisation, and to ensure you get the maximum benefit, it is recommended that staff join training sessions to understand how to interact with Copilot and how to leverage it for productivity and innovation.

Strategic Al evolution

Innovations in AI are changing at a rapid pace. ramsac can help customers review and update their Copilot strategy and policies, and identify new opportunities and future use cases, to ensure you are getting the most out of your implementation.
